

Use xTIMEcomposer Studio to build a project

To build your project, select your project in the **Project Explorer**, click the arrow next to the **Build** button and select either **Debug** or **Release**.

xTIMEcomposer uses the Makefile in your project to determine the configuration settings used with the compiler.

Double-click the project **Makefile** in the *Project Explorer* to open it in the Makefile Editor, where you can set the compiler options. The *XCC Command-Line Manual* (see [XM-000927-PC](#)) lists all supported compiler options.

If there are no errors in your program, xTIMEcomposer adds the compiled binary file to the **Binaries** folder in your project.

Errors are reported in the **Console**. Double-click a message highlighted red to locate it in the editor.
