# 1 xCORE Multicore Microcontrollers

The xCORE200 Series is a comprehensive range of 32-bit multicore microcontrollers that brings the low latency and timing determinism of the xCORE architecture to mainstream embedded applications. Unlike conventional microcontrollers, xCORE multicore microcontrollers execute multiple real-time tasks simultaneously and communicate between tasks using a high speed network. Because xCORE multicore microcontrollers are completely deterministic, you can write software to implement functions that traditionally require dedicated hardware.

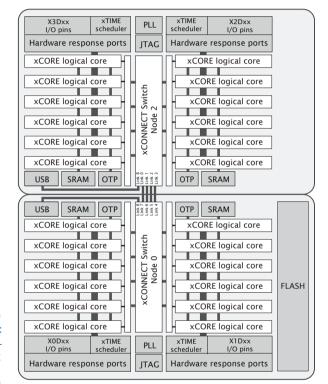

Figure 1: XUF224-1024-FB374 block diagram

Key features of the XUF224-1024-FB374 include:

- ▶ Tiles: Devices consist of one or more xCORE tiles. Each tile contains between five and eight 32-bit xCOREs with highly integrated I/O and on-chip memory.
- Logical cores Each logical core can execute tasks such as computational code, DSP code, control software (including logic decisions and executing a state machine) or software that handles I/O. Section 6.1
- xTIME scheduler The xTIME scheduler performs functions similar to an RTOS, in hardware. It services and synchronizes events in a core, so there is no requirement for interrupt handler routines. The xTIME scheduler triggers cores on events generated by hardware resources such as the I/O pins, communication channels and timers. Once

triggered, a core runs independently and concurrently to other cores, until it pauses to wait for more events. Section  $6.2\,$ 

- Channels and channel ends Tasks running on logical cores communicate using channels formed between two channel ends. Data can be passed synchronously or asynchronously between the channel ends assigned to the communicating tasks. Section 6.5
- xCONNECT Switch and Links Between tiles, channel communications are implemented over a high performance network of xCONNECT Links and routed through a hardware xCONNECT Switch. Section 6.6
- ▶ **Ports** The I/O pins are connected to the processing cores by Hardware Response ports. The port logic can drive its pins high and low, or it can sample the value on its pins optionally waiting for a particular condition. Section 6.3
- Clock blocks xCORE devices include a set of programmable clock blocks that can be used to govern the rate at which ports execute. Section 6.4
- Memory Each xCORE Tile integrates a bank of SRAM for instructions and data, and a block of one-time programmable (OTP) memory that can be configured for system wide security features. Section 9
- PLL The PLL is used to create a high-speed processor clock given a low speed external oscillator. Section 7
- ▶ USB The USB PHY provides High-Speed and Full-Speed, device, host, and on-the-go functionality. Data is communicated through ports on the digital node. A library is provided to implement USB device functionality. Section 10
- ▶ Flash The device has a built-in 2MBflash. Section 8
- ▶ JTAG The JTAG module can be used for loading programs, boundary scan testing, in-circuit source-level debugging and programming the OTP memory. Section 11

### 1.1 Software

Devices are programmed using C, C++ or xC (C with multicore extensions). XMOS provides tested and proven software libraries, which allow you to quickly add interface and processor functionality such as USB, Ethernet, PWM, graphics driver, and audio EQ to your applications.

### 1.2 xTIMEcomposer Studio

The xTIMEcomposer Studio development environment provides all the tools you need to write and debug your programs, profile your application, and write images into flash memory or OTP memory on the device. Because xCORE devices operate deterministically, they can be simulated like hardware within xTIMEcomposer: uniquely in the embedded world, xTIMEcomposer Studio therefore includes a static timing analyzer, cycle-accurate simulator, and high-speed in-circuit instrumentation.

xTIMEcomposer can be driven from either a graphical development environment, or the command line. The tools are supported on Windows, Linux and MacOS X and available at no cost from xmos.ai/software-tools.

# 2 XUF224-1024-FB374 Features

#### Multicore Microcontroller with Advanced Multi-Core RISC Architecture

- · 24 real-time logical cores on 4 xCORE tiles
- Cores share up to 2000 MIPS
- Up to 4000 MIPS in dual issue mode
- Each logical core has:
  - Guaranteed throughput of between 1/5 and 1/6 of tile MIPS
- 16x32bit dedicated registers
   167 bigh depaits (16/22 bit instruction)
- 167 high-density 16/32-bit instructions
  - All have single clock-cycle execution (except for divide)
  - − 32x32→64-bit MAC instructions for DSP, arithmetic and user-definable cryptographic functions

### ► Dual USB PHY, fully compliant with USB 2.0 specification

#### Programmable I/O

- 176 general-purpose I/O pins, configurable as input or output
  - Up to 56 x 1bit port, 22 x 4bit port, 13 x 8bit port, 6 x 16bit port, 4 x 32bit port
     8 xCONNECT links
- Port sampling rates of up to 60 MHz with respect to an external clock
- 128 channel ends (32 per tile) for communication with other cores, on or off-chip

#### Memory

- 1024KB internal single-cycle SRAM (max 256KB per tile) for code and data storage
- 32KB internal OTP (max 8KB per tile) for application boot code
- 2MB internal flash for application code and overlays

#### Hardware resources

- 24 clock blocks (6 per tile)
- 40 timers (10 per tile)
- 16 locks (4 per tile)

#### ► JTAG Module for On-Chip Debug

#### Security Features

- · Programming lock disables debug and prevents read-back of memory contents
- · AES bootloader ensures secrecy of IP held on external flash memory
- ► Ambient Temperature Range
  - -40 °C to 85 °C
- Speed Grade

40: 2000 MIPS

- Power Consumption
  - 1140 mA (typical)
- ▶ 374-pin FBGA package 0.8 mm pitch

# 4 Signal Description

This section lists the signals and I/O pins available on the XUF224-1024-FB374. The device provides a combination of 1bit, 4bit, 8bit and 16bit ports, as well as wider ports that are fully or partially (gray) bonded out. All pins of a port provide either output or input, but signals in different directions cannot be mapped onto the same port.

Pins may have one or more of the following properties:

- PD/PU: The IO pin has a weak pull-down or pull-up resistor. The resistor is enabled during and after reset. Enabling a link or port that uses the pin disables the resistor. Thereafter, the resistor can be enabled or disabled under software control. The resistor is designed to ensure defined logic input state for unconnected pins. It should not be used to pull external circuitry. Note that the resistors are highly non-linear and only a maximum pull current is specified in Section 13.3.
- ST: The IO pin has a Schmitt Trigger on its input.
- ▶ IOT: The IO pin is powered from VDDIOT (X1) or VDDIOT\_2 (X3), not VDDIO
- ▶ IO: the pin is powered from VDDIO

	Power pins (12)		
Signal	Function	Туре	Properties
GND	Digital ground	GND

# 6 Product Overview

The XUF224-1024-FB374 is a powerful device that consists of four xCORE Tiles, each comprising a flexible logical processing cores with tightly integrated I/O and on-chip memory.

### 6.1 Logical cores

Each tile has 6 active logical cores, which issue instructions down a shared five-stage pipeline. Instructions from the active cores are issued round-robin. If up to five logical cores are active, each core is allocated a fifth of the processing cycles. If more than five logical cores are active, each core is allocated at least  $\frac{1}{n}$  cycles (for *n* cores). Figure 3 shows the guaranteed core performance depending on the number of cores used.

Figure 3:
Logical core
performance

Figure 3:	Speed	MIPS	Frequency	M	linimun	n MIPS	per co	re (for r	o cores)	)
gical core	grade			1	2	3	4	5	6	
formance	20	2000 MIPS	500 MHz	100	100	100	100	100	83	

There is no way that the performance of a logical core can be reduced below these predicted levels (unless priority threads are used: in this case the guaranteed minimum performance is computed based on the number of priority threads as defined in the architecture manual). Because cores may be delayed on I/O, however, their unused processing cycles can be taken by other cores. This means that for more than five logical cores, the performance of each core is often higher than the predicted minimum but cannot be guaranteed.

The logical cores are triggered by events instead of interrupts and run to completion. A logical core can be paused to wait for an event.

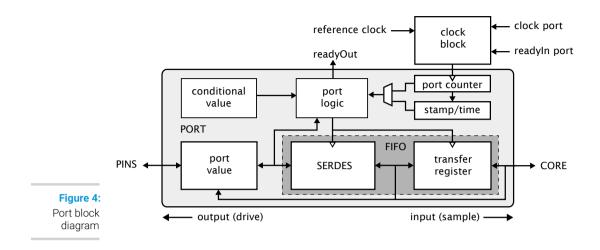

### 6.2 xTIME scheduler

The xTIME scheduler handles the events generated by xCORE Tile resources, such as channel ends, timers and I/O pins. It ensures that all events are serviced and synchronized, without the need for an RTOS. Events that occur at the I/O pins are handled by the Hardware-Response ports and fed directly to the appropriate xCORE Tile. An xCORE Tile can also choose to wait for a specified time to elapse, or for data to become available on a channel.

Tasks do not need to be prioritised as each of them runs on their own logical xCORE. It is possible to share a set of low priority tasks on a single core using cooperative multitaskina.

### 6.3 Hardware Response Ports

Hardware Response ports connect an xCORE tile to one or more physical pins and as such define the interface between hardware attached to the XUF224-1024-FB374, and the software running on it. A combination of 1bit, 4bit, 8bit, 16bit and 32bit ports are available. All pins of a port provide either output or input. Signals in different directions cannot be mapped onto the same port.

The port logic can drive its pins high or low, or it can sample the value on its pins, optionally waiting for a particular condition. Ports are accessed using dedicated instructions that are executed in a single processor cycle. xCORE200 IO pins can be used as *open collector* outputs, where signals are driven low if a zero is output, but left high impedance if a one is output. This option is set on a per-port basis.

Data is transferred between the pins and core using a FIFO that comprises a SERDES and transfer register, providing options for serialization and buffered data.

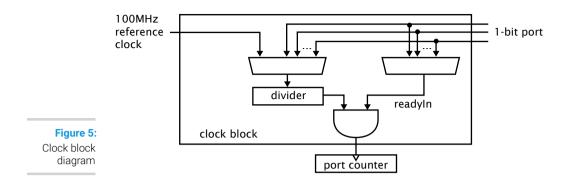

Each port has a 16-bit counter that can be used to control the time at which data is transferred between the port value and transfer register. The counter values can be obtained at any time to find out when data was obtained, or used to delay I/O until some time in the future. The port counter value is automatically saved as a timestamp, that can be used to provide precise control of response times.

The ports and xCONNECT links are multiplexed onto the physical pins. If an xConnect Link is enabled, the pins of the underlying ports are disabled. If a port is enabled, it overrules ports with higher widths that share the same pins. The pins on the wider port that are not shared remain available for use when the narrower port is enabled. Ports always operate at their specified width, even if they share pins with another port.

### 6.4 Clock blocks

xCORE devices include a set of programmable clocks called clock blocks that can be used to govern the rate at which ports execute. Each xCORE tile has six clock blocks: the first clock block provides the tile reference clock and runs at a default frequency of 100MHz; the remaining clock blocks can be set to run at different frequencies.

A clock block can use a 1-bit port as its clock source allowing external application clocks to be used to drive the input and output interfaces. xCORE200 clock blocks optionally divide the clock input from a 1-bit port.

In many cases I/O signals are accompanied by strobing signals. The xCORE ports can input and interpret strobe (known as readyln and readyOut) signals generated by external sources, and ports can generate strobe signals to accompany output data.

On reset, each port is connected to clock block 0, which runs from the xCORE Tile reference clock.

### 6.5 Channels and Channel Ends

Logical cores communicate using point-to-point connections, formed between two channel ends. A channel-end is a resource on an xCORE tile, that is allocated by the program. Each channel-end has a unique system-wide identifier that comprises a unique number and their tile identifier. Data is transmitted to a channel-end by an output-instruction; and the other side executes an input-instruction. Data can be passed synchronously or asynchronously between the channel ends.

### 6.6 xCONNECT Switch and Links

XMOS devices provide a scalable architecture, where multiple xCORE devices can be connected together to form one system. Each xCORE device has an xCONNECT interconnect that provides a communication infrastructure for all tasks that run on the various xCORE tiles on the system.

The interconnect relies on a collection of switches and XMOS links. Each xCORE device has an on-chip switch that can set up circuits or route data. The switches are connected by xConnect Links. An XMOS link provides a physical connection between two switches. The switch has a routing algorithm that supports many different topologies, including lines, meshes, trees, and hypercubes.

The links operate in either 2 wires per direction or 5 wires per direction mode, depending on the amount of bandwidth required. Circuit switched, streaming and packet switched data can both be supported efficiently. Streams provide the fastest possible data rates between xCORE Tiles (up to 250 MBit/s), but each stream requires a single link to be reserved between switches on two tiles. All packet communications can be multiplexed onto a single link.

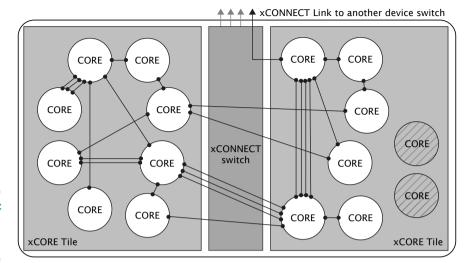

Figure 6: Switch, links and channel ends

Information on the supported routing topologies that can be used to connect multiple devices together can be found in the XS1-UF Link Performance and Design Guide, X2999.

# 7 PLL

The PLL creates a high-speed clock that is used for the switch, tile, and reference clock. The PLL multiplication value is selected through the two MODE pins, and can be changed by software to speed up the tile or use less power. The MODE pins are set as shown in Figure 7:

	Oscillator	MC	DDE	Tile Boot	PLL Ratio	PLL	setting	gs
	Frequency	1	0	Frequency		OD	F	R
Figure 7:	3.25-10 MHz	0	0	130-400 MHz	40	1	159	0
PLL multiplier	9-25 MHz	1	1	144-400 MHz	16	1	63	0
values and	25-50 MHz	1	0	167-400 MHz	8	1	31	0
MODE pins	50-100 MHz	0	1	196-400 MHz	4	1	15	0

Figure 7 also lists the values of OD, F and R, which are the registers that define the ratio of the tile frequency to the oscillator frequency:

$$F_{core} = F_{osc} \times \frac{F+1}{2} \times \frac{1}{R+1} \times \frac{1}{OD+1}$$

OD, F and R must be chosen so that  $0 \le R \le 63$ ,  $0 \le F \le 4095$ ,  $0 \le OD \le 7$ , and  $260MHz \le F_{osc} \times \frac{F+1}{2} \times \frac{1}{R+1} \le 1.3GHz$ . The OD, F, and R values can be modified by writing to the digital node PLL configuration register.

The MODE pins must be held at a static value during and after deassertion of the system reset. If the USB PHY is used, then either a 24 MHz or 12 MHz oscillator must be used.

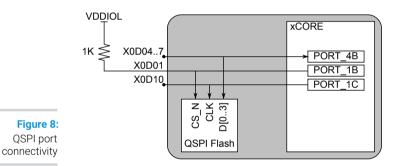

If a different tile frequency is required (eg, 500 MHz), then the PLL must be reprogrammed after boot to provide the required tile frequency. The XMOS tools perform this operation by default. Further details on configuring the clock can be found in the xCORE-200 Clock Frequency Control document.

# 8 Boot Procedure

The device is kept in reset by driving RST\_N low. When in reset, all GPIO pins have a pulldown enabled. The processor must be held in reset until VDDIOL is in spec for at least 1 ms. When the device is taken out of reset by releasing RST\_N the processor starts its internal reset process. After 15-150  $\mu$ s (depending on the input clock) the processor boots.

Pin X2D06 must be pulled high with an external pull-up whilst the chip comes out of reset, to ensure that tile 2 will boot from link. X2D04, X2D05, and X2D07 should be kept low whilst the chip comes out of reset.

The device boots from a QSPI flash (IS25LP016D) that is embedded in the device. The QSPI flash is connected to the ports on Tile 0 as shown in Figure 8. An external 1K resistor must connect X0D01 to VDDIOL. X0D10 should ideally not be connected. If X0D10 is connected, then a 150 ohm series resistor close to the device is recommended. X0D04..X0D07 should be not connected.

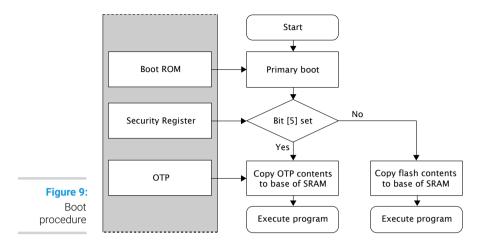

The xCORE Tile boot procedure is illustrated in Figure 9. If bit 5 of the security register (see §9.1) is set, the device boots from OTP. Otherwise, the device boots from the internal flash.

The boot image has the following format:

- ▶ A 32-bit program size *s* in words.
- Program consisting of  $s \times 4$  bytes.
- A 32-bit CRC, or the value 0x0D15AB1E to indicate that no CRC check should be performed.

The program size and CRC are stored least significant byte first. The program is loaded into the lowest memory address of RAM, and the program is started from that address. The CRC is calculated over the byte stream represented by the program size and the

program itself. The polynomial used is 0xEDB88320 (IEEE 802.3); the CRC register is initialized with 0xFFFFFFF and the residue is inverted to produce the CRC.

### 8.1 Security register

The security register enables security features on the xCORE tile. The features shown in Figure 10 provide a strong level of protection and are sufficient for providing strong IP security.

# 9 Memory

### 9.1 OTP

Each xCORE Tile integrates 8 KB one-time programmable (OTP) memory along with a security register that configures system wide security features. The OTP holds data in four sectors each containing 512 rows of 32 bits which can be used to implement secure bootloaders and store encryption keys. Data for the security register is loaded from the OTP on power up. All additional data in OTP is copied from the OTP to SRAM and executed first on the processor.

The OTP memory is programmed using three special I/O ports: the OTP address port is a 16-bit port with resource ID 0x100200, the OTP data is written via a 32-bit port with resource ID 0x200100, and the OTP control is on a 16-bit port with ID 0x100300. Programming is performed through **libotp** and **xburn**.

### 9.2 SRAM

Each xCORE Tile integrates a single 256KB SRAM bank for both instructions and data. All internal memory is 32 bits wide, and instructions are either 16-bit or 32-bit. Byte (8-bit), half-word (16-bit) or word (32-bit) accesses are supported and are executed within one tile clock cycle. There is no dedicated external memory interface, although data memory can be expanded through appropriate use of the ports.

Feature	Bit	Description
Disable JTAG	0	The JTAG interface is disabled, making it impossible for the tile state or memory content to be accessed via the JTAG interface.
Disable Link access	1	Other tiles are forbidden access to the processor state via the system switch. Disabling both JTAG and Link access trans forms an xCORE Tile into a "secure island" with other tiles free for non-secure user application code.
Secure Boot	5	The xCORE Tile is forced to boot from address 0 of the OTF allowing the xCORE Tile boot ROM to be bypassed (see §8).
Redundant rows	7	Enables redundant rows in OTP.
Sector Lock 0	8	Disable programming of OTP sector 0.
Sector Lock 1	9	Disable programming of OTP sector 1.
Sector Lock 2	10	Disable programming of OTP sector 2.
Sector Lock 3	11	Disable programming of OTP sector 3.
OTP Master Lock	12	Disable OTP programming completely: disables updates to all sectors and security register.
Disable JTAG-OTP	13	Disable all (read & write) access from the JTAG interface to this OTP.
Disable Global Debug	14	Disables access to the DEBUG_N pin.
	2115	General purpose software accessable security register avai able to end-users.
	3122	General purpose user programmable JTAG UserID code extension.

Figure 10: Security

#### register features

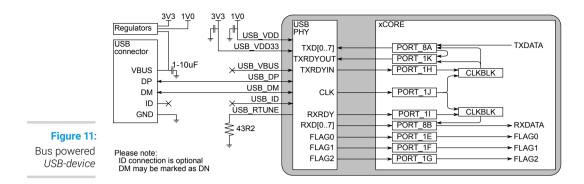

# 10 USB PHY

The USB PHY provides High-Speed and Full-Speed, device, host, and on-the-go functionality. The PHY is configured through a set of peripheral registers (Appendix F), and data is communicated through ports on the digital node. A library, XUD, is provided to implement *USB-device* functionality.

The USB PHY is connected to the ports on Tile 0 and Tile 1 as shown in Figure 11. When the USB PHY is enabled on Tile 0, the ports shown can on Tile 0 only be used with the USB PHY. When the USB PHY is enabled on Tile 1, then the ports shown can on Tile 1 only be used with the USB PHY. All other IO pins and ports are unaffected. The USB PHY should not be enabled on both tiles. Two clock blocks can be used to clock the USB ports. One clock block for the TXDATA path, and one clock block for the RXDATA path. Details on how to connect those ports are documented in an application note on USB for xCORE200.

An external resistor of 43.2 ohm (1% tolerance) should connect USB\_RTUNE to ground, as close as possible to the device.

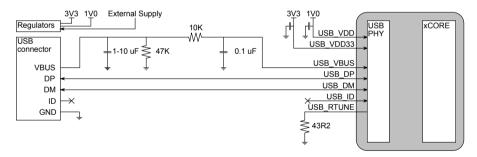

### 10.1 USB VBUS

USB\_VBUS need not be connected if the device is wholly powered by USB, and the device is used to implement a USB-device.

If you use the USB PHY to design a self-powered USB-device, then the device must be able detect the presence of VBus on the USB connector (so the device can disconnect its pull-up resistors from D+/D- to ensure the device does not have any voltage on the D+/D-pins when VBus is not present, "USB Back Voltage Test"). This requires USB\_VBUS to be connected to the VBUS pin of the USB connector as is shown in Figure 12.

When connecting a USB cable to the device it is possible an overvoltage transient will be present on VBus due to the inductance of the USB cable combined with the required input capacitor on VBus. The circuit in Figure 12 ensures that the transient does not damage the device. The 10k series resistor and 0.1uF capacitor ensure than any input transient is filtered and does not reach the device. The 47k resistor to ground is a bleeder resistor to discharge the input capacitor when VBus is not present. The 1-10uF input capacitor is required as part of the USB specification. A typical value would be 2.2uF to ensure the 1uF minimum requirement is met even under voltage bias conditions.

In any case, extra components (such as a ferrite bead and diodes) may be required for EMC compliance and ESD protection. Different wiring is required for USB-host and USB-OTG.

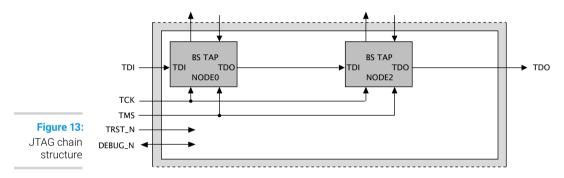

### 10.2 Logical Core Requirements

The XMOS XUD software component runs in a single logical core with endpoint and application cores communicating with it via a combination of channel communication and shared memory variables.

Each IN (host requests data from device) or OUT (data transferred from host to device) endpoint requires one logical core.

# 11 JTAG

The JTAG module can be used for loading programs, boundary scan testing, in-circuit source-level debugging and programming the OTP memory.

The JTAG chain structure is illustrated in Figure 13. It comprises two 1149.1 compliant TAPs that can be used for boundary scan of the I/O pins. Each tap has a 4-bit IR and 32-bit DR. It also provides access to a chip TAP that in turn can access the xCORE Tile for loading code and debugging.

The TRST\_N pin must be asserted low during and after power up for 100 ns. If JTAG is not required, the TRST\_N pin can be tied to ground to hold the JTAG module in reset.

The DEBUG\_N pin is used to synchronize the debugging of multiple xCORE Tiles. This pin can operate in both output and input mode. In output mode and when configured to do so, DEBUG\_N is driven low by the device when the processor hits a debug break point. Prior to this point the pin will be tri-stated. In input mode and when configured to do so, driving this pin low will put the xCORE Tile into debug mode. Software can set the behavior of the xCORE Tile based on this pin. This pin should have an external pull up of 4K7-47K  $\Omega$  or left not connected in single core applications.

The JTAG device identification register can be read by using the IDCODE instruction. Its contents are specified in Figure 14.

Figure 14	Bit	31											C	)evic	e Ide	ntific	atior	n Reg	giste	r											E	BitO

			)			(	)			0	)			(	0			5	5			(	5			3	3			3	3	

The JTAG usercode register can be read by using the USERCODE instruction. Its contents are specified in Figure 15. The OTP User ID field is read from bits [22:31] of the security register on xCORE Tile 0, see §9.1 (all zero on unprogrammed devices).

# 12 Board Integration

The device has the following power supply pins:

- VDD pins for the xCORE Tile, including USB\_VDD and USB\_2\_VDD pins that power the USB PHY
- ▶ VDDIO pins for the I/O lines
- PLL\_AVDD pins for the PLL
- ▶ OTP\_VCC pins for the OTP
- ▶ USB\_VDD33 and USB\_2\_VDD33 pins for the analogue supply to the USB-PHY

Several pins of each type are provided to minimize the effect of inductance within the package, all of which must be connected. The power supplies must be brought up monotonically and input voltages must not exceed specification at any time.

VDDIO/OTP\_VCC and VDD can ramp up independently. In order to reduce stresses on the device, it is preferable to make them ramp up in a short time frame of each other, no more than 50 ms apart. RST\_N and TRST\_N should be kept low until all power supplies are stable and within tolerances of their final voltage. If your design is powered by VBUS, then RST\_N should go high within 10 ms of attaching to VBUS in order to ensure that USB timings are met. RST\_N should be at least 1 ms after VDDIO good to enable the built-in flash to settle. Power sequencing is summarised in Figure 16

The PLL\_AVDD supply should be separated from the other noisier supplies on the board. The PLL requires a very clean power supply, and a low pass filter (for example, a  $2.2 \Omega$  resistor and 100 nF multi-layer ceramic capacitor) is recommended on this pin.

The following ground pins are provided:

- PLL\_AGND for PLL\_AVDD
- ▶ GND for all other supplies

All ground pins must be connected directly to the board ground.

The VDD and VDDIO supplies should be decoupled close to the chip by several 100 nF low inductance multi-layer ceramic capacitors between the supplies and GND (for example, 100nF 0402 for every other supply pin). The ground side of the decoupling capacitors should have as short a path back to the GND pins as possible. A bulk decoupling capacitor of at least 10 uF should be placed on each of these supplies.

RST\_N is an active-low asynchronous-assertion global reset signal. Following a reset, the PLL re-establishes lock after which the device boots up according to the boot mode (see §3). RST\_N and must be asserted low during and after power up for 100 ns.

### 12.1 USB connections

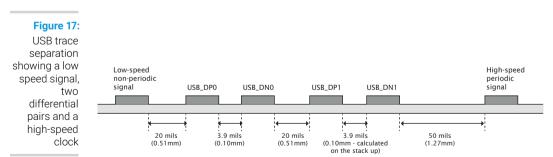

USB\_VBUS should be connected to the VBUS pin of the USB connector. A 2.2 uF capacitor to ground is required on the VBUS pin. A ferrite bead may be used to reduce HF noise.

For self-powered systems, a bleeder resistor may be required to stop VBUS from floating when no USB cable is attached.

 $\mathsf{USB\_DP}$  and  $\mathsf{USB\_DN}$  should be connected to the USB connector.  $\mathsf{USB\_ID}$  does not need to be connected.

### 12.2 USB signal routing and placement

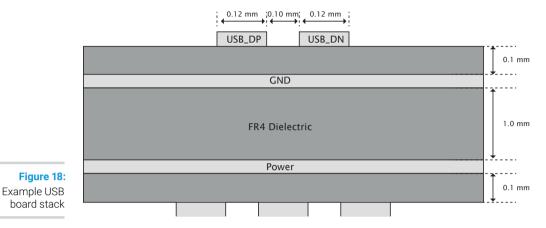

The USB\_DP and USB\_DN lines are the positive and negative data polarities of a high speed USB signal respectively. Their high-speed differential nature implies that they must be coupled and properly isolated. The board design must ensure that the board traces for USB\_DP and USB\_DN are tightly matched. In addition, according to the USB 2.0 specification, the USB\_DP and USB\_DN differential impedance must be 90  $\Omega$ .

### 12.2.1 General routing and placement guidelines

The following guidelines will help to avoid signal quality and EMI problems on high speed USB designs. They relate to a four-layer (Signal, GND, Power, Signal) PCB.

For best results, most of the routing should be done on the top layer (assuming the USB connector and XUF224-1024-FB374 are on the top layer) closest to GND. Reference planes should be below the transmission lines in order to maintain control of the trace impedance.

We recommend that the high-speed clock and high-speed USB differential pairs are routed first before any other routing. When routing high speed USB signals, the following guide-lines should be followed:

- ▶ High speed differential pairs should be routed together.
- ▶ High-speed USB signal pair traces should be trace-length matched. Maximum trace-length mismatch should be no greater than 4mm.
- Ensure that high speed signals (clocks, USB differential pairs) are routed as far away from off-board connectors as possible.
- High-speed clock and periodic signal traces that run parallel should be at least 1.27mm away from USB\_DP/USB\_DN (see Figure 17).
- Low-speed and non-periodic signal traces that run parallel should be at least 0.5mm away from USB\_DP/USB\_DN (see Figure 17).
- ▶ Route high speed USB signals on the top of the PCB wherever possible.
- Route high speed USB traces over continuous power planes, with no breaks. If a tradeoff must be made, changing signal layers is preferable to crossing plane splits.
- Follow the  $20 \times h$  rule; keep traces  $20 \times h$  (the height above the power plane) away from the edge of the power plane.
- ▶ Use a minimum of vias in high speed USB traces.

- Avoid corners in the trace. Where necessary, rather than turning through a 90 degree angle, use two 45 degree turns or an arc.
- ▶ DO NOT route USB traces near clock sources, clocked circuits or magnetic devices.
- ▶ Avoid stubs on high speed USB signals.

#### 12.3 Land patterns and solder stencils

The package is a 374 ball Fine Ball Grid Array (FBGA) on a 0.8 mm pitch.

The land patterns and solder stencils will depend on the PCB manufacturing process. We recommend you design them with using the IPC specifications *"Generic Requirements for Surface Mount Design and Land Pattern Standards"* IPC-7351B. This standard aims to achieve desired targets of heel, toe and side fillets for solder-joints. The mechanical drawings in Section 14 specify the dimensions and tolerances.

### 12.4 Ground and Thermal Vias

Vias next to each ground ball into the ground plane of the PCB are recommended for a low inductance ground connection and good thermal performance.

### 12.5 Moisture Sensitivity

XMOS devices are, like all semiconductor devices, susceptible to moisture absorption. When removed from the sealed packaging, the devices slowly absorb moisture from the surrounding environment. If the level of moisture present in the device is too high during reflow, damage can occur due to the increased internal vapour pressure of moisture. Example damage can include bond wire damage, die lifting, internal or external package cracks and/or delamination.

All XMOS devices are Moisture Sensitivity Level (MSL) 3 - devices have a shelf life of 168 hours between removal from the packaging and reflow, provided they are stored below 30C and 60% RH. If devices have exceeded these values or an included moisture indicator card shows excessive levels of moisture, then the parts should be baked as appropriate before use. This is based on information from *Joint IPC/JEDEC Standard For Moisture/Reflow Sensitivity Classification For Nonhermetic Solid State Surface-Mount Devices J-STD-020* Revision D.

# **13 Electrical Characteristics**

### 13.1 Absolute Maximum Ratings

Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Symbol	Parameter	MIN	MAX	UNITS	Notes
VDD	Tile DC supply voltage	-0.2	1.1	V	
PLL_AVDD	PLL analog supply	-0.2	1.1	V	
VDDIO	I/O supply voltage	-0.3	3.75	V	
OTP_VCC	OTP supply voltage	-0.3	3.75	V	
Tj	Junction temperature		125	°C	
Tstg	Storage temperature	-65	150	°C	
V(Vin)	Voltage applied to any IO pin	-0.3	3.75	V	
I(XxDxx)	GPIO current	-30	30	mA	
V(X0D03-8)	Voltage applied to flash pins	-0.3	VDDIO+0.5	V	
I(VDDIO)	Current for VDDIO domain		2064	mA	A, B, C
I(VDDIOT)	Current for VDDIOT domain		98	mA	A, C
USB_VDD	USB tile DC supply voltage	-0.2	1.1	V	
USB_VDD33	USB tile analog supply voltage	-0.3	3.75	V	
USB_VBUS	USB VBUS voltage	-0.3	5.75	V	
USB_DP	USB DP voltage	-0.3	5.5	V	
USB_DM	USB DM voltage	-0.3	5.5	V	
USB_ID	USB ID voltage	-0.3	2.75	V	

Figure 19: Absolute maximum ratings

A Exceeding these current limits will result in premature aging and reduced lifetime.

B This current consumption must be evenly distributed over all VDDIO pins.

C All main power (VDD, VDDIO) and ground (VSS) pins must always be connected.

# 13.2 Operating Conditions

Symbol	Parameter	MIN	ТҮР	MAX	UNITS	Notes
VDD	Tile DC supply voltage	0.95	1.00	1.05	V

# 13.6 Power Consumption

Symbol	Parameter	MIN	ТҮР	MAX	UNITS	Notes
I(DDCQ)	Quiescent VDD current		90		mA	A, B, C
PD	Tile power dissipation		325		µW/MIPS	A, D, E, F
IDD	Active VDD current		1140	1400	mA	A, G
I(ADDPLL)	PLL_AVDD current		10	14	mA	Н
I(VDD33)	VDD33 current		53.4		mA	1
I(USB_VDD)	USB_VDD current		16.6		mA	J

Figure 25: **xCORE** Tile currents

- A Use for budgetary purposes only.
- B Assumes typical tile and I/O voltages with no switching activity.
- C Includes PLL current.
- D Assumes typical tile and I/O voltages with nominal switching activity.
- E Assumes 1 MHz = 1 MIPS.
- F PD(TYP) value is the usage power consumption under typical operating conditions.
- G Measurement conditions: VDD = 1.0 V, VDDIO = 3.3 V, 25 °C, 500 MHz, average device resource usage.
- H PLL\_AVDD = 1.0 V

HS mode transmitting while driving all 0's data (constant JKJK on DP/DM). Loading of 10 pF. Transfers do not I include any interpacket delay.

J HS receive mode; no traffic.

The tile power consumption of the device is highly application dependent and should be used for budgetary purposes only.

More detailed power analysis can be found in the xCORE-200 Power Consumption document.

#### 13.7 Clock

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
f	Frequency	3.25	24	100	MHz	
SR	Slew rate	0.10			V/ns	
TJ(LT)	Long term jitter (pk-pk)			2	%	А
f(MAX)	Processor clock frequency			500	MHz	В

Figure 26: Clock

A Percentage of CLK period.

B Assumes typical tile and I/O voltages with nominal activity.

Further details can be found in the xCORE-200 Clock Frequency Control document,

### 13.8 xCORE Tile I/O AC Characteristics

	Symbol	Parameter	MIN	ТҮР	MAX	UNITS	Notes
	T(XOVALID)	Input data valid window	8			ns	
Figure 27:	T(XOINVALID)	Output data invalid window	9			ns	
I/O AC charac- teristics	T(XIFMAX)	Rate at which data can be sampled with respect to an external clock			60	MHz	

The input valid window parameter relates to the capability of the device to capture data input to the chip with respect to an external clock source. It is calculated as the sum of the input setup time and input hold time with respect to the external clock as measured at the pins. The output invalid window specifies the time for which an output is invalid with respect to the external clock. Note that these parameters are specified as a window rather than absolute numbers since the device provides functionality to delay the incoming clock with respect to the incoming data.

Information on interfacing to high-speed synchronous interfaces can be found in the Port I/O Timing document, X5821.

### 13.9 xConnect Link Performance

Symbol	Parameter	MIN	ТҮР	MAX	UNITS	Notes
B(2blinkP)	2b link bandwidth (packetized)			87	MBit/s	A, B
B(5blinkP)	5b link bandwidth (packetized)			217	MBit/s	A, B
B(2blinkS)	2b link bandwidth (streaming)			100	MBit/s	В
B(5blinkS)	5b link bandwidth (streaming)			250	MBit/s	В

Assumes 32-byte packet in 3-byte header mode. Actual performance depends on size of the header and A payload.

B 7.5 ns symbol time.

The asynchronous nature of links means that the relative phasing of CLK clocks is not important in a multi-clock system, providing each meets the required stability criteria.

# 13.10 JTAG Timing

Symbol	Parameter	MIN	ТҮР	MAX	UNITS	Notes
f(TCK_D)	TCK frequency (debug)			18	MHz	
f(TCK_B)	TCK frequency (boundary scan)			10	MHz	
T(SETUP)	TDO to TCK setup time	5			ns	А
T(HOLD)	TDO to TCK hold time	5			ns	А
T(DELAY)	TCK to output delay			15	ns	В

Figure 29: JTAG timing

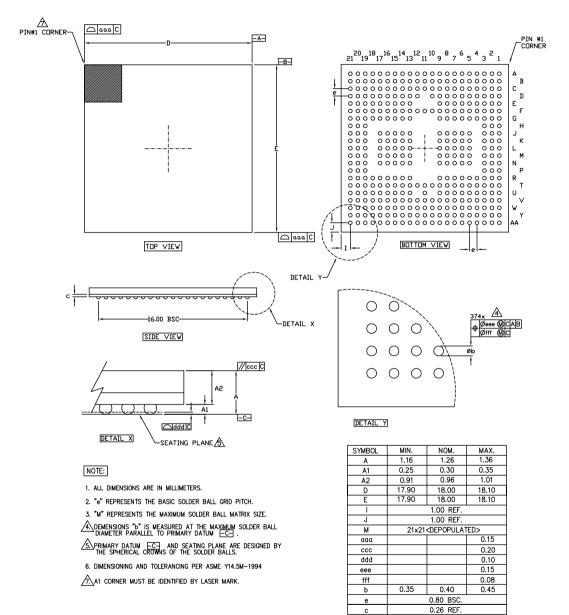

Figure 28: Link performance

A Timing applies to TMS and TDI inputs.

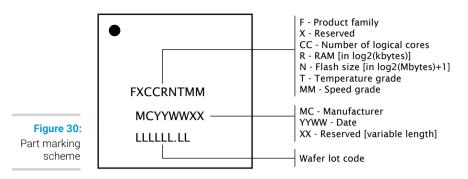

B Timing applies to TDO output from negative edge of TCK.

All JTAG operations are synchronous to TCK apart from the global asynchronous reset TRST\_N.

# 14 Package Information

### 14.1 Part Marking

# **15 Ordering Information**

Figure 31:	Product Code	Marking	Qualification	Speed Grade
	XUF224-1024-FB374-C40A	U124A2C40	Commercial	2000 MIPS

# Appendices

# A Configuration of the XUF224-1024-FB374

The device is configured through banks of registers, as shown in Figure 32.

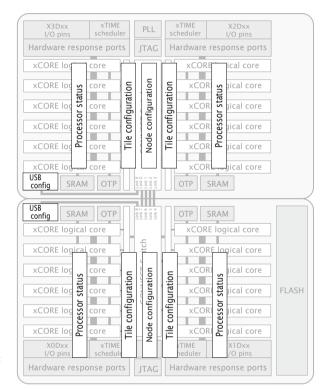

Figure 32: Registers

The following communication sequences specify how to access those registers. Any messages transmitted contain the most significant 24 bits of the channel-end to which a response is to be sent. This comprises the node-identifier and the channel number within the node. if no response is required on a write operation, supply 24-bits with the last 8-bits set, which suppresses the reply message. Any multi-byte data is sent most significant byte first.

# A.1 Accessing a processor status register

The processor status registers are accessed directly from the processor instruction set. The instructions GETPS and SETPS read and write a word. The register number should be translated into a processor-status resource identifier by shifting the register number left 8 places, and ORing it with 0x0B. Alternatively, the functions getps(reg) and  $setps( \rightarrow reg, value)$  can be used from XC.

## A.2 Accessing an xCORE Tile configuration register

xCORE Tile configuration registers can be accessed through the interconnect using the functions write\_tile\_config\_reg(tileref, ...) and read\_tile\_config\_reg(tile ref,  $\leftrightarrow$  ...), where tileref is the name of the xCORE Tile, e.g. tile[1]. These functions implement the protocols described below.

Instead of using the functions above, a channel-end can be allocated to communicate with the xCORE tile configuration registers. The destination of the channel-end should be set to <code>0xnnnnc2oc</code> where <code>nnnnn</code> is the tile-identifier.

A write message comprises the following:

 control-token
 24-bit response
 16-bit
 32-bit
 control-token

 192
 channel-end identifier
 register number
 data
 1

The response to a write message comprises either control tokens 3 and 1 (for success), or control tokens 4 and 1 (for failure).

A read message comprises the following:

control-token	24-bit response	16-bit	control-token
193	channel-end identifier	register number	1

The response to the read message comprises either control token 3, 32-bit of data, and control-token 1 (for success), or control tokens 4 and 1 (for failure).

### A.3 Accessing node configuration

Node configuration registers can be accessed through the interconnect using the functionswrite\_node\_config\_reg(device, ...) and read\_node\_config\_reg(device, ...), where device is the name of the node. These functions implement the protocols described below.

Instead of using the functions above, a channel-end can be allocated to communicate with the node configuration registers. The destination of the channel-end should be set to <code>0xnnnc30c</code> where <code>nnnn</code> is the node-identifier.

A write message comprises the following:

control-token	24-bit response	16-bit	32-bit	control-token
192	channel-end identifier	register number	data	1

The response to a write message comprises either control tokens 3 and 1 (for success), or control tokens 4 and 1 (for failure).

A read message comprises the following:

control-token	24-bit response	16-bit	control-token
193	channel-end identifier	register number	1

The response to a read message comprises either control token 3, 32-bit of data, and control-token 1 (for success), or control tokens 4 and 1 (for failure).

# A.4 Accessing a register of an analogue peripheral

Peripheral registers can be accessed through the interconnect using the functions write\_periph\_32  $\hookrightarrow$  (device, peripheral, ...), read\_periph\_32(device, peripheral, ...), write\_periph\_8  $\hookrightarrow$  (device, peripheral, ...), and read\_periph\_8(device, peripheral, ...); where device is the name of the analogue device, and peripheral is the number of the peripheral. These functions implement the protocols described below.

A channel-end should be allocated to communicate with the configuration registers. The destination of the channel-end should be set to <code>0xnnnnpp02</code> where <code>nnnn</code> is the node-identifier and <code>pp</code> is the peripheral identifier.

A write message comprises the following:

control-token	24-bit response	8-bit	8-bit	data	control-token
36	channel-end identifier	register number	size		1

The response to a write message comprises either control tokens 3 and 1 (for success), or control tokens 4 and 1 (for failure).

A read message comprises the following:

control-token	24-bit response	8-bit	8-bit	control-token
37	channel-end identifier	register number	size	1

The response to the read message comprises either control token 3, data, and control-token 1 (for success), or control tokens 4 and 1 (for failure).

# **B** Processor Status Configuration

The processor status control registers can be accessed directly by the processor using processor status reads and writes (use getps(reg) and setps(reg,value) for reads and writes).

The identifiers for the registers needs a prefix "<code>XS1\_PS\_</code>" and a postfix "<code>\_NUM</code>", and are declared in "<code>xs1.h</code>"

# B.2 Vector base address

# VECTOR\_BASE 0x01

Base address of event vectors in each resource. On an interrupt or event, the 16 most significant bits of the destination address are provided by this register; the least significant 16 bits come from the event vector.

0x01:	Bits	Perm	Init	Description	Identifier
Vector base	31:18	RW		The event and interrupt vectors.	VECTOR_BASE
address	17:0	RO	-	Reserved	

# B.3 xCORE Tile control

#### XCORE\_CTRL0 0x02

Register to control features in the xCORE tile

Bits	Perm	Init	Description Identifier
31:26	RO	-	Reserved
25:18	RW	0	RGMII TX data delay value (in PLL output cycle increments)
17:9	RW	0	RGMII TX clock divider value. TX clk rises when counter (clocked by PLL output) reaches this value and falls when counter reaches (value»1). Value programmed into this field should be actual divide value required minus 1
8	RW	0	Enable RGMII interface periph ports xcore_ctrlo_rgmii_enable
7:6	RO	-	Reserved
5	RW	0	Select the dynamic mode (1) for the clock divider when the clock divider is enabled. In dynamic mode the clock divider is only activated when all active threads are paused. In static mode the clock divider is always enabled.
4	RW	0	Enable the clock divider. This divides the output of the PLL to facilitate one of the low power modes.
3	RO	-	Reserved
2	RW		Select between UTMI (1) and ULPI (0) mode. xcore_ctrlo_USB_MODE
1	RW		Enable the ULPI Hardware support module xcore_ctrlo_USB_ENABLE
0	RO	-	Reserved

0x02: xCORE Tile control

# B.4 xCORE Tile boot status

#### BOOT\_CONFIG 0x03

This read-only register describes the boot status of the xCORE tile.

	Bits	Perm	Init	Description	Identifier
	31:24	RO	-	Reserved	
	23:16	RO		Processor number.	BOOT_CONFIG_PROCESSOR
	15:9	RO	-	Reserved	
	8	RO		Overwrite BOOT_MODE.	BOOT_CONFIG_SECURE_BOOT
	7:6	RO	-	Reserved	
	5	RO		Indicates if core1 has been powered off	BOOT_CONFIG_CORE1_POWER_DOWN_N
	4	RO		Cause the ROM to not poll the OTP for corr	ect read levels BOOT_CONFIG_DISABLE_OTP_POLL
0x03:	3	RO		Boot ROM boots from RAM	BOOT_CONFIG_BOOT_FROM_RAM
xCORE Tile	2	RO		Boot ROM boots from JTAG	BOOT_CONFIG_BOOT_FROM_JTAG
boot status	1:0	RO		The boot PLL mode pin value.	BOOT_CONFIG_PLL_MODE_PINS

# B.5 Security configuration

# SECURITY\_CONFIG 0x05

Copy of the security register as read from OTP.

Bits	Perm	Init	Description	Identifier
31	RW		Disables write permission on this register	SECUR_CFG_DISABLE_ACCESS
30:15	RO	-	Reserved	
14	RW		Disable access to XCore's global debug	SECUR_CFG_DISABLE_GLOBAL_DEBUG
13	RO	-	Reserved	
12	RW		lock all OTP sectors	SECUR_CFG_OTP_MASTER_LOCK
11:8	RW		lock bit for each OTP sector	SECUR_CFG_OTP_SECTOR_LOCK
7	RW		Enable OTP reduanacy	SECUR_CFG_OTP_RED UANACY_ENABLE
6	RO	-	Reserved	
5	RW		Override boot mode and read boot image fr	OMOTP SECUR_CFG_SECURE_BOOT
4	RW		Disable JTAG access to the PLL/BOOT cont	figuration registers <pre>secur_cfg_disable_pll_jtag</pre>
3:1	RO	-	Reserved	
0	RW		Disable access to XCore's JTAG debug TAP	SECUR_CFG_DISABLE_XCORE_JTAG

#### 0x05: Security configuration

# B.6 Ring Oscillator Control

#### RING\_OSC\_CTRL 0x06

There are four free-running oscillators that clock four counters. The oscillators can be started and stopped using this register. The counters should only be read when the ring oscillator has been stopped for at least 10 core clock cycles (this can be achieved by inserting two nop instructions between the SETPS and GETPS). The counter values can be read using four subsequent registers. The ring oscillators are asynchronous to the xCORE tile clock and can be used as a source of random bits.

0x06:
<b>Ring Oscillator</b>
Control

Bits	Perm	Init	Description	Identifier
31:2	RO	-	Reserved	
1	RW	0	Core ring oscillator enable.	RING_OSC_CORE_ENABLE
0	RW	0	Peripheral ring oscillator enable.	RING_OSC_PERPH_ENABLE

## B.7 Ring Oscillator Value

#### RING\_OSC\_DATAO 0x07

This register contains the current count of the xCORE Tile Cell ring oscillator. This value is not reset on a system reset.

<b>0x07:</b> Ring Oscillator Value	Bits	Perm	Init	Description	Identifier
	31:16	RO	-	Reserved	
	15:0	RO	0	Ring oscillator Counter data.	RING_OSC_DATA

#### B.8 Ring Oscillator Value

#### RING\_OSC\_DATA1 0x08

This register contains the current count of the xCORE Tile Wire ring oscillator. This value is not reset on a system reset.

<b>0x08:</b> Ring Oscillator Value	Bits	Perm	Init	Description	Identifier
	31:16	RO	-	Reserved	
	15:0	RO	0	Ring oscillator Counter data.	RING_OSC_DATA

# B.9 Ring Oscillator Value

#### RING\_OSC\_DATA2 0x09

This register contains the current count of the Peripheral Cell ring oscillator. This value is not reset on a system reset.

<b>0x09:</b> Ring Oscillator Value	Bits	Perm	Init	Description	Identifier
	31:16	RO	-	Reserved	
	15:0	RO	0	Ring oscillator Counter data.	RING_OSC_DATA

# B.10 Ring Oscillator Value

## RING\_OSC\_DATA3 OxOA

RAM\_SIZE OxOC

This register contains the current count of the Peripheral Wire ring oscillator. This value is not reset on a system reset.

0x0A:	Bits	Perm	Init	Description	Identifier
Ring Oscillator	31:16	RO	-	Reserved	
Value	15:0	RO	0	Ring oscillator Counter data.	RING_OSC_DATA

# B.11 RAM size

The size of the RAM in bytes

	Bits	Perm	Init	Description	Identifier
<b>0x0C:</b> RAM size	31:2	RO		Most significant 16 bits of all addresses.	WORD _ADDRESS_BITS
	1:0	RO	-	Reserved	

# B.12 Debug SSR

#### DBG\_SSR 0x10

This register contains the value of the SSR register when the debugger was called.

Bits	Perm	Init	Description	Identifier
31:11	RO	-	Reserved	
10	DRW		Address space indentifier	SR_QUEUE
9	DRW		Determines the issue mode (DI bit) upon Kernel Entry after or Interrupt.	Exception
8	RO		Determines the issue mode (DI bit).	SR_DI
7	DRW		When 1 the thread is in fast mode and will continually issue	SR_FAST
6	DRW		When 1 the thread is paused waiting for events, a lock resource.	or another SR_WAITING
5	RO	-	Reserved	
4	DRW		1 when in kernel mode.	SR_INK
3	DRW		1 when in an interrupt handler.	SR_ININT
2	DRW		1 when in an event enabling sequence.	SR_INENB
1	DRW		When 1 interrupts are enabled for the thread.	SR_IEBLE
0	DRW		When 1 events are enabled for the thread.	SR_EEBLE

# B.13 Debug SPC

#### DBG\_SPC 0x11

This register contains the value of the SPC register when the debugger was called.

0x11:	Bits	Perm	Init	Description	Identifier
Debug SPC	31:0	DRW		Value.	ALL_BITS

## B.14 Debug SSP

#### DBG\_SSP 0x12

This register contains the value of the SSP register when the debugger was called.

0x12:	Bits	Perm	Init	Description	Identifier
Debug SSP	31:0	DRW		Value.	ALL_BITS

## B.15 DGETREG operand 1

DBG\_T\_NUM 0x13

The resource ID of the logical core whose state is to be read.

0x13:	Bits	Perm	Init	Description	Identifier
DGETREG	31:8	RO	-	Reserved	
operand 1	7:0	DRW		Thread number to be read	DBG_T_NUM_NUM

#### B.16 DGETREG operand 2

DBG\_T\_REG 0x14

Register number to be read by DGETREG

0x14:	Bits	Perm	Init	Description	Identifier
DGETREG	31:5	RO	-	Reserved	
operand 2	4:0	DRW		Register number to be read	DBG_T_REG_REG

#### B.17 Debug interrupt type

#### DBG\_TYPE 0x15

Register that specifies what activated the debug interrupt.

	Bits	Perm	Init	Description	Identifier
	31:18	RO	-	Reserved	
	17:16	DRW		Number of the hardware breakpoint/watchpoint which interrupt (always 0 for =HOST= and =DCALL=). If mu points/watchpoints trigger at once, the lowest number is	ultiple break-
	15:8	DRW		Number of thread which caused the debug interrupt (alw case of =HOST=).	/ays O in the DBG_TYPE_T_NUM
	7:3	RO	-	Reserved	
<b>0x15:</b> Debug interrupt type	2:0	DRW	0	<ul> <li>Indicates the cause of the debug interrupt</li> <li>1: Host initiated a debug interrupt through JTAG</li> <li>2: Program executed a DCALL instruction</li> <li>3: Instruction breakpoint</li> <li>4: Data watch point</li> <li>5: Resource watch point</li> </ul>	DBG_TYPE_CAUSE

B.18 Debug interrupt data

#### DBG\_DATA 0x16

On a data watchpoint, this register contains the effective address of the memory operation that triggered the debugger. On a resource watchpoint, it countains the resource identifier.

0x16:					
Debug	Bits	Perm	Init	Description	Identifier
interrupt data	31:0	DRW		Value.	ALL_BITS

#### B.19 Debug core control

#### DBG\_RUN\_CTRL 0x18

This register enables the debugger to temporarily disable logical cores. When returning from the debug interrupts, the cores set in this register will not execute. This enables single stepping to be implemented.

	Bits	Perm	Init	Description Identifier
	31:8	RO	-	Reserved
0x18: Debug core control	7:0	DRW		1-hot vector defining which threads are stopped when not in debug mode. Every bit which is set prevents the respective thread from running.

#### B.20 Debug scratch

#### DBG\_SCRATCH 0x20 .. 0x27

A set of registers used by the debug ROM to communicate with an external debugger, for example over JTAG. This is the same set of registers as the Debug Scratch registers in the xCORE tile configuration.

0x20 0x27:	Bits	Perm	Init	Description	Identifier
Debug scratch	31:0	DRW		Value.	ALL_BITS

#### B.21 Instruction breakpoint address DBG\_IBREAK\_ADDR 0x30 .. 0x33

This register contains the address of the instruction breakpoint. If the PC matches this address, then a debug interrupt will be taken. There are four instruction breakpoints that are controlled individually.

#### 0x30 .. 0x33: Instruction breakpoint address

ר t	Bits	Perm	Init	Description	Identifier
5	31:0	DRW		Value.	ALL_BITS

#### B.22 Instruction breakpoint control DBG\_IBREAK\_CTRL 0x40 .. 0x43

This register controls which logical cores may take an instruction breakpoint, and under which condition.

	Bits	Perm	Init	Description Identifier
	31:24	RO	-	Reserved
	23:16	DRW	0	A bit for each thread in the machine allowing the breakpoint to be enabled individually for each thread. $$\tt BEK\_THREADS$$
0x40 0x43:	15:2	RO	-	Reserved
Instruction breakpoint control	1	DRW	0	When 0 break when PC == IBREAK_ADDR. When 1 = break when PC != IBREAK_ADDR.
	0	DRW	0	When 1 the instruction breakpoint is enabled.

# B.23 Data watchpoint address 1 DBG\_DWATCH\_ADDR1 0x50 .. 0x53

This set of registers contains the first address for the four data watchpoints.

<b>0x50 0x53:</b> Data watchpoint					
	Bits	Perm	Init	Description	Identifier
address 1	31:0	DRW		Value.	ALL_BITS

# B.24 Data watchpoint address 2 DBG\_DWATCH\_ADDR2 0x60 .. 0x63

This set of registers contains the second address for the four data watchpoints.

<b>0x60 0x63:</b> Data watchpoint					
	Bits	Perm	Init	Description	Identifier
address 2	31:0	DRW		Value.	ALL_BITS

# B.25 Data breakpoint control register DBG\_DWATCH\_CTRL 0x70 .. 0x73

This set of registers controls each of the four data watchpoints.

	Bits	Perm	Init	Description	Identifier
	31:24	RO	-	Reserved	
	23:16	DRW	0	A bit for each thread in the machine allowing the breakpoin abled individually for each thread.	nt to be en-
x70 0x73:	15:3	RO	-	Reserved	
Data breakpoint	2	DRW	0	When 1 the breakpoints will be be triggered on loads.	BRK_LOAD
control	1	DRW	0	Determines the break condition: 0 = A AND B, 1 = A OR B.	DBRK_CONDITION
	0	DRW	0	When 1 the instruction breakpoint is enabled.	BRK_ENABLE

#### B.26 Resources breakpoint mask DBG\_RWATCH\_ADDR1 0x80 .. 0x83

This set of registers contains the mask for the four resource watchpoints.

0x80 0x83:					
Resources breakpoint	Bits	Perm	Init	Description	Identifier
mask	31:0	DRW		Value.	ALL_BITS

#### B.27 Resources breakpoint value DBG\_RWATCH\_ADDR2 0x90 .. 0x93

This set of registers contains the value for the four resource watchpoints.

0x90 0x93: Resources breakpoint					
	Bits	Perm	Init	Description	Identifier
value	31:0	DRW		Value.	ALL_BITS

# B.28 Resources breakpoint control register DBG\_RWATCH\_CTRL 0x9C ... 0x9F

This set of registers controls each of the four resource watchpoints.

0x70

	Bits	Perm	Init	Description Identifier
	31:24	RO	-	Reserved
	23:16	DRW	0	A bit for each thread in the machine allowing the breakpoint to be enabled individually for each thread. $$\tt BEK\_THREADS$$
0x9C 0x9F: Resources	15:2	RO	-	Reserved
breakpoint control	1	DRW	0	When 0 break when condition A is met. When 1 = break when condition B is met.
register	0	DRW	0	When 1 the instruction breakpoint is enabled. $${\tt BRK\_EMABLE}$$

# **C** Tile Configuration

The xCORE Tile control registers can be accessed using configuration reads and writes (usewrite\_tile\_config\_reg(tileref, ...) and read\_tile\_config\_reg(tileref, ...) for reads and writes).

The identifiers for the registers needs a prefix "XS1\_PSWITCH\_" and a postfix "\_NUM", and are declared in "xs1.h"

Number	Perm	Description	Register identifier
0x00	CRO	Device identification	DEVICE_ID0
0x01	CRO	xCORE Tile description 1	DEVICE_ID 1
0x02	CRO	xCORE Tile description 2	DEVICE_ID2
0x04	CRW	Control PSwitch permissions to debug registers	DBG_CTRL
0x05	CRW	Cause debug interrupts	DBG_INT
0x06	CRW	xCORE Tile clock divider	PLL_CLK_DIVIDER
0x07	CRO	Security configuration	SECU_CONFIG
0x20 0x27	CRW	Debug scratch	DBG_SCRATCH
0x40	CRO	PC of logical core 0	TO_PC

CRO

CRO

CRO

#### C.3 xCORE Tile description 2

#### DEVICE\_ID2 0x02

This register describes the number of timers and clock blocks available on this xCORE tile.

	Bits	Perm	Init	Description	Identifier
0x02:	31:16	RO	-	Reserved	
xCORE Tile	15:8	CRO		Number of clock blocks.	DEVICE_ID 2_NUM_CLKBLKS
description 2	7:0	CRO		Number of timers.	DEVICE_ID2_NUM_TIMERS

#### C.4 Control PSwitch permissions to debug registers DBG\_CTRL 0x04

This register can be used to control whether the debug registers (marked with permission CRW) are accessible through the tile configuration registers. When this bit is set, write -access to those registers is disabled, preventing debugging of the xCORE tile over the interconnect.

0x04: Control PSwitch permissions to debug registers

	Bits	Perm	Init	Description Identifier	
trol tch	31	CRW	0	When 1 the PSwitch is restricted to RO access to all CRW registers from SSwitch, XCore(PS_DBG_Scratch) and JTAG	
ons	30:1	RO	-	Reserved	
oug ers	0	CRW	0	When 1 the PSwitch is restricted to RO access to all CRW registers fro SSwitch	

#### C.5 Cause debug interrupts

#### DBG\_INT 0x05

This register can be used to raise a debug interrupt in this xCORE tile.

0x05 Cause debug interrupts

	Bits	Perm	Init	Description	Identifier
5:	31:2	RO	-	Reserved	
ıg	1	CRW	0	1 when the processor is in debug mode.	DBG_INT_IN_DBG
S	0	CRW	0	Request a debug interrupt on the processor.	DBG_INT_REQ_DBG

#### C.6 xCORE Tile clock divider

#### PLL\_CLK\_DIVIDER 0x06

This register contains the value used to divide the PLL clock to create the xCORE tile clock. The divider is enabled under control of the tile control register

	Bits	Perm	Init	Description	Identifier
0x06: xCORE Tile clock divider	31	CRW	0	Clock disable. Writing '1' will remove the clock to the tile.	PLL_CLK_DISABLE
	30:16	RO	-	Reserved	
	15:0	CRW	0	Clock divider.	PLL_CLK_DIVIDER

# C.7 Security configuration

SECU\_CONFIG 0x07

Copy of the security register as read from OTP.

Identifier	Description	Init	Perm	Bits
SECUR_CFG_DISABLE_ACCESS	Disables write permission on this register		CRO	31
	Reserved	-	RO	30:15
SECUR_CFG_DISABLE_GLOBAL_DEBUG	Disable access to XCore's global debug		CRO	14
	Reserved	-	RO	13
SECUR_CFG_OTP_MASTER_LOC	lock all OTP sectors		CRO	12
SECUR_CFG_OTP_SECTOR_LOC	lock bit for each OTP sector		CRO	11:8
SECUR_CFG_OTP_RED UANACY_ENABL	Enable OTP reduanacy		CRO	7
	Reserved	-	RO	6
n OTP secur_cfg_secure_boo	Override boot mode and read boot image from		CRO	5
JURATION REGISTERS	Disable JTAG access to the PLL/BOOT config		CRO	4
	Reserved	-	RO	3:1
SECUR_CFG_DISABLE_XCORE_JTA	Disable access to XCore's JTAG debug TAP		CRO	0

0x07 Security configuration

#### C.8 Debug scratch

#### DBG\_SCRATCH 0x20 .. 0x27

A set of registers used by the debug ROM to communicate with an external debugger, for example over the switch. This is the same set of registers as the Debug Scratch registers in the processor status.

0x20 0x27: Bit	Bits	Perm	Init	Description	Identifier

# **D** Node Configuration

The digital node control registers can be accessed using configuration reads and writes (use write\_node\_config\_reg(device, ...) and read\_node\_config\_reg(device, ...) for reads and writes).

The identifiers for the registers needs a prefix "XS1\_SSWITCH\_" and a postfix "\_NUM", and are declared in "xs1.h"

Number	Perm	Description	Register identifier
0x00	RO	Device identification	DEVICE_ID0
0x01	RO	System switch description	DEVICE_ID 1
0x04	RW	Switch configuration	NODE_CONFIG
0x05	RW	Switch node identifier	NODE_ID
0x06	RW	PLL settings	PLL_CTL
0x07	RW	System switch clock divider	CLK_DIVIDER
0x08	RW	Reference clock	REF_CLK_DIVIDER
0x09	R	System JTAG device ID register	JTAG_DEVICE_ID

#### Figure 36: Summary

#### D.1 Device identification

#### DEVICE\_ID0 0x00

This register contains version and revision identifiers and the mode-pins as sampled at boot-time.

	Bits	Perm	Init	Description	Identifier
	31:24	RO	-	Reserved	
0x00:	23:16	RO		Sampled values of BootCtl pins on Power On Res	Set. ss_device_ido_boot_ctrl
Device	15:8	RO		SSwitch revision.	SS_DEVICE_ID0_REVISION
identification	7:0	RO		SSwitch version.	SS_DEVICE_ID0_VERSION

# D.2 System switch description

## DEVICE\_ID1 0x01

This register specifies the number of processors and links that are connected to this switch.

	Bits	Perm	Init	Description	Identifier
	31:24	RO	-	Reserved	
0x01:	23:16	RO		Number of SLinks on the SSwitch.	SS_DEVICE_ID1_NUM_SLINKS
System switch	15:8	RO		Number of processors on the SSwitch.	SS_DEVICE_ID1_NUM_PROCESSORS
description	7:0	RO		Number of processors on the device.	SS_DEVICE_ID1_NUM_PLINKS_PER_PROC

# D.3 Switch configuration

#### NODE\_CONFIG 0x04

This register enables the setting of two security modes (that disable updates to the PLL or any other registers) and the header-mode.

Bits	Perm	Init	Description Identifier
31	RW	0	0 = SSCTL registers have write access. 1 = SSCTL registers can not be written to. ss_NODE_CONFIG_DISABLE_SSCTL_UPDATE
30:9	RO	-	Reserved
8	RW	0	0 = PLL_CTL_REG has write access. 1 = PLL_CTL_REG can not be writ- ten to. ss_node_conFIG_DISABLE_PLL_CTL_REG
7:1	RO	-	Reserved
0	RW	0	0 = 2-byte headers, 1 = 1-byte headers (reset as 0). ss_node_config_headers

#### D.4 Switch node identifier

0x04: Switch configuration

#### NODE\_ID 0x05

PLL\_CTL 0x06

This register contains the node identifier.

0x05:	Bits	Perm	Init	Description	Identifier
Switch node	31:16	RO	-	Reserved	
identifier	15:0	RW	0	The unique ID of this node.	SS_NODE_ID_ID

#### D.5 PLL settings

An on-chip PLL multiplies the input clock up to a higher frequency clock, used to clock the I/O, processor, and switch, see Oscillator. Note: a write to this register will cause the tile to be reset.

Identifier	Description	Init	Perm	Bits
SS_PLL_CTL_NRESET	If set to 1, the chip will not be reset		RW	31
ock. Only use this if a ss_pll_ctl_NLOCK	If set to 1, the chip will not wait for the PLL to re-loo gradual change is made to the PLL		RW	30
SS_TEST_WODE_PLL_BYPASS	If set to 1, set the PLL to be bypassed		DW	29

0	RW		If set, XCore0 is the source of last GlobalDebug event. GLOBAL_DEBUG_SOURCE_XCOREO_INDEBUG	IG

0x1F: Debug source

#### D.15 Link status, direction, and network

SLINK 0x20 .. 0x28

These registers contain status information for low level debugging (read-only), the network number that each link belongs to, and the direction that each link is part of. The registers control links 0..7.

Bits	Perm	Init	Description Identifie	er
31:26	RO	-	Reserved	
25:24	RO		Identify the SRC_TARGET type 0 - SLink, 1 - PLink, 2 - SSCTL, 3 Undefine.	
23:16	RO		When the link is in use, this is the destination link number to which a packets are sent.	
15:12	RO	-	Reserved	
11:8	RW	0	The direction that this link operates in.	ON
7:6	RO	-	Reserved	
5:4	RW	0	Determines the network to which this link belongs, reset as 0.	JRK
3	RO	-	Reserved	
2	RO		1 when the current packet is considered junk and will be thrown awa $$\tt LINK_JU$	,
1	RO		1 when the dest side of the link is in use.	SE
0	RO		1 when the source side of the link is in use.	SE

0x20 .. 0x28: Link status, direction, and network

#### D.16 PLink status and network

#### PLINK 0x40 .. 0x47

These registers contain status information and the network number that each processorlink belongs to.

Bits	Perm	Init	Description Identifier
31:26	RO	-	Reserved
25:24	RO		Identify the SRC_TARGET type 0 - SLink, 1 - PLink, 2 - SSCTL, 3 - Undefine.
23:16	RO		When the link is in use, this is the destination link number to which all packets are sent. $$\tt PLINK\_SRC\_TARGET\_ID$$
15:6	RO	-	Reserved
5:4	RW	0	Determines the network to which this link belongs, reset as 0. $$_{\tt LINK\_NETWORK}$$
3	RO	-	Reserved
2	RO		1 when the current packet is considered junk and will be thrown away. $$_{\tt LINK\_JUNK}$$
1	RO		1 when the dest side of the link is in use.
0	RO		1 when the source side of the link is in use.

# D.17 Link configuration and initialization

XLINK 0x80 .. 0x88

These registers contain configuration and debugging information specific to external links. The link speed and width can be set, the link can be initialized, and the link status can be monitored. The registers control links 0..7.

Bits Perm Init Description	Identifier
	h '1' will enable the XLink, writing '0' will disable it e muxing of ports with overlapping xlinks.
31 RW	XLINK_ENABLE

0x80..0x88 Link configuration and initialization

# D.18 Static link configuration

#### XSTATIC 0xA0 .. 0xA7

These registers are used for static (ie, non-routed) links. When a link is made static, all traffic is forwarded to the designated channel end and no routing is attempted. The registers control links C, D, A, B, G, H, E, and F in that order.

Bits	Perm	Init	Description	Identifier
31	RW	0	Enable static forwarding.	X STATIC_ENABLE
30:9	RO	-	Reserved	
8	RW	0	The destination processor on this node that packets mode are forwarded to.	received in static
7:5	RO	-	Reserved	
4:0	RW	0	The destination channel end on this node that packets mode are forwarded to.	S received in static XSTATIC_DEST_CHAN_END

0xA0 .. 0xA7: Static link configuration

# **E USB Node Configuration**

The USB node control registers can be accessed using configuration reads and writes (USE write\_node\_config\_reg(device, ...) and read\_node\_config\_reg(device, ...) for reads and writes).

Number	Perm	Description	Register identifier
0x00	RO	Device identification register	DEV_ID

## F.8 UIFM signal flags

#### GLX\_PER\_UIFM\_IFM\_FLAGS 0x1C

Set of flags that monitor line and error states. These flags normally clear on the next packet, but they may be made sticky by using PER\_UIFM\_FLAGS\_STICKY, in which they must be cleared explicitly.

Bits	Perm	Init	Description Identifier
31:7	RO	-	Reserved
6	RW	0	Set to 1 when the UIFM decodes a token successfully (e.g. it passes CRC5, PID check and has matching device address). UIFM_IFM_FLAGS_NEWTOKEN
5	RW	0	Set to 1 when linestate indicates an SE0 symbol.
4	RW	0	Set to 1 when linestate indicates a K symbol.
3	RW	0	Set to 1 when linestate indicates a J symbol.
2	RW	0	Set to 1 if an incoming datapacket fails the CRC16 check.
1	RW	0	Set to the value of the UTMI_RXACTIVE input signal. UIFM_FLAGS_RXACTIVE
0	RW	0	Set to the value of the UTMI_RXERROR input signal UIFM_IFM_FLAGS_RXERROR

**0x1C:** UIFM signal flags

# F.9 UIFM Sticky flags

#### GLX\_PER\_UIFM\_FLAGS\_STICKY 0x20

These bits define the sticky-ness of the bits in the UIFM IFM FLAGS register. A 1 means that bit will be sticky (hold its value until a 1 is written to that bitfield), or normal, in which case signal updates to the UIFM IFM FLAGS bits may be over-written by subsequent changes in those signals.

<b>0x20:</b> UIFM Sticky flags	Bits	Perm	Init	Description	Identifier
	31:7	RO	-	Reserved	
	6:0	RW	0	Stickyness for each flag.	UIFM_FLAGS_STICKY_STICKY

# F.10 UIFM port masks

#### GLX\_PER\_UIFM\_MASK 0x24

Set of masks that identify how port 1N, port 1O and port 1P are affected by changes to the flags in  $\mathsf{FLAGS}$ 

Bits	Perm	Init	Description Ident	tifier
31:24	RW	0	Bit mask that determines which flags in UIFM_IFM_FLAG[6:0] tribute to port 1?. If any flag listed in this bitmask is high, port 1? w high.	vill be
23:16	RW	0	Bit mask that determines which flags in UIFM_IFM_FLAG[6:0] tribute to port 1P. If any flag listed in this bitmask is high, port 1P w high.	vill be
15:8	RW	0	Bit mask that determines which flags in UIFM_IFM_FLAG[6:0] tribute to port 10. If any flag listed in this bitmask is high, port 10 be high.	D will
7:0	RW	0	Bit mask that determines which flags in UIFM_IFM_FLAG[6:0] tribute to port 1N. If any flag listed in this bitmask is high, port 1N be high.	l will

0x24: UIFM port masks

# F.11 UIFM SOF value

# GLX\_PER\_UIFM\_SOFCOUNT 0x28

# USB Start-Of-Frame counter

	Bits	Perm	Init	Description	Identifier
0x28: UIFM SOF value	31:11	RO	-	Reserved	
	10:8	RW	0	Most significant 3 bits of SOF counter	UIFM_SOFCOUNT_COUNT2
	7:0	RW	0	Least significant 8 bits of SOF counter	UIFM_SOFCOUNT_COUNT1

# GLX\_PER\_UIFM\_PID 0x2C

# F.12 UIFM PID

The last USB packet identifier received

	Bits	Perm	Init	Description	Identifier
0x2C: UIFM PID	31:4	RO	-	Reserved	
	3:0	RO	0	Value of the last received PID.	UIFM_PID_PID

#### F.13 UIFM Endpoint

#### GLX\_PER\_UIFM\_ENDPOINT 0x30

The last endpoint seen

	Bits	Perm	Init	Description	Identifier
0x30: UIFM Endpoint	31:5	RO	-	Reserved	
	4	RO	0	1 if endpoint contains a valid value.	UIFM_ENDPOINT_MATCH
	3:0	RO	0	A copy of the last received endpoint.	UIFM_ENDPOINT_ENDPOINT

#### F.14 UIFM Endpoint match GLX\_PER\_UIFM\_ENDPOINT\_MATCH 0x34

This register can be used to mark UIFM endpoints as special.

	Bits	Perm	Init	Description Identifier
0x34:	31:16	RO	-	Reserved
UIFM Endpoint match	15:0	RW	0	This register contains a bit for each endpoint. If its bit is set, the end- point will be supplied on the RX port when ORed with 0x10.

# F.15 OTG Flags mask

#### GLX\_PER\_UIFM\_OTG\_FLAGS\_MASK 0x38

0x38: OTG Flags mask	Bits	Perm	Init	Description	Identifier
	31:0	RW	0	Data	DTG_FLAGS_MASK_DEFINED

#### F.16 UIFM power signalling

#### GLX\_PER\_UIFM\_PWRSIG 0x3C

	Bits	Perm	Init	Description	Identifier
0x3C:	31:9	RO	-	Reserved	
ower	8	RW	0	Valid	UIFM_PWRSIG_VALID
alling	7:0	RW	0	Data	UIFM_PWRSIG_DATA

0 UIFM pc signa

# F.17 UIFM PHY control

# GLX\_PER\_UIFM\_PHY\_CONTROL 0x40

Bits	Perm	Init	Description Identifier
31:19	RO	-	Reserved
18	RW	0	Set to 1 to disable pulldowns on ports 8A and 8B.
17:14	RO	-	Reserved
13	RW	0	After an auto-resume, this bit is set to indicate that the resume signalling was for reset (se0). Set to 0 to clear.
12	RW	0	After an auto-resume, this bit is set to indicate that the resume signalling was for resume (K). Set to 0 to clear.
11:8	RW	0	Log-2 number of clocks before any linestate change is propagated.
7	RW	0	Set to 1 to use the suspend controller handle to resume from suspend. Otherwise, the program has to poll the linestate_filt field in phy_teststatus.
6:4	RW	0	Control the the conf1,2,3 input pins of the PHY. UIFM_PHY_CONTROL_PHYCONF
3:0	RO	-	Reserved

0x40: UIFM PHY control

#### JTAG, xSCOPE and Debugging G

If you intend to design a board that can be used with the XMOS toolchain and xTAG debugger, you will need an xSYS header on your board. Figure 39 shows a decision diagram which explains what type of xSYS connectivity you need. The three subsections below explain the options in detail.

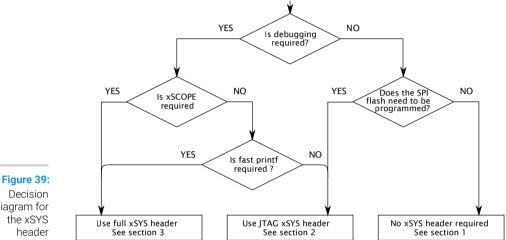

diagram for

## G.1 No xSYS header

The use of an xSYS header is optional, and may not be required for volume production designs. However, the XMOS toolchain expects the xSYS header; if you do not have an xSYS header then you must provide your own method for writing to flash/OTP and for debugging.

#### G.2 JTAG-only xSYS header

The xSYS header connects to an xTAG debugger, which has a 20-pin 0.1" female IDC header. The design will hence need a male IDC header. We advise to use a boxed header to guard against incorrect plug-ins. If you use a 90 degree angled header, make sure that pins 2, 4, 6, ..., 20 are along the edge of the PCB.

Connect pins 4, 8, 12, 16, 20 of the xSYS header to ground, and then connect:

- TDI to pin 5 of the xSYS header
- TMS to pin 7 of the xSYS header
- TCK to pin 9 of the xSYS header
- DEBUG\_N to pin 11 of the xSYS header
- TDO to pin 13 of the xSYS header

The RST\_N net should be open-drain, active-low, and have a pull-up to VDDIO.

#### G.3 Full xSYS header

For a full xSYS header you will need to connect the pins as discussed in Section G.2, and then connect a 2-wire xCONNECT Link to the xSYS header. The links can be found in the Signal description table (Section 4): they are labelled XL0, XL1, etc in the function column. The 2-wire link comprises two inputs and outputs, labelled  $\frac{1}{out}$ ,  $\frac{0}{out}$ ,  $\frac{0}{in}$ , and  $\frac{1}{in}$ . For example, if you choose to use XL0 for xSCOPE I/O, you need to connect up XL0 $_{out}^{1}$ , XL0 $_{out}^{0}$ , XL0 $_{in}^{1}$ , XL0 $_{in}^{1}$ , XL0 $_{in}^{1}$ , XL0 $_{in}^{1}$  as follows:

- XL0<sup>1</sup><sub>out</sub> (X0D43) to pin 6 of the xSYS header with a 33R series resistor close to the device.
- XL0<sup>0</sup><sub>out</sub> (X0D42) to pin 10 of the xSYS header with a 33R series resistor close to the device.
- >  $XL0_{in}^{0}$  (X0D41) to pin 14 of the xSYS header.
- >  $XLO_{in}^{1}$  (X0D40) to pin 18 of the xSYS header.

# H Schematics Design Check List

✓ This section is a checklist for use by schematics designers using the XUF224-1024-FB374. Each of the following sections contains items to check for each design.

#### H.1 Power supplies

- The VDD (core) supply ramps monotonically (rises constantly) from 0V to its final value (0.95V 1.05V) within 10ms (Section 12).
- The VDD (core) supply is capable of supplying 1400 mA (Section 12 and Figure 21).
- PLL\_AVDD is filtered with a low pass filter, for example an RC filter, see Section 12

#### H.2 Power supply decoupling

- The design has multiple decoupling capacitors per supply, for example at least four0402 or 0603 size surface mount capacitors of 100nF in value, per supply (Section 12).
- A bulk decoupling capacitor of at least 10uF is placed on each supply (Section 12).

#### H.3 Power on reset

The RST\_N and TRST\_N pins are asserted (low) until all supplies are good. There is enough time between VDDIO power good and RST\_N to allow any boot flash to settle. RST\_N is fast enough to meet USB timings.

#### H.4 Clock

- The CLK input pin is supplied with a clock with monotonic rising edges and low jitter.
- Pins MODE0 and MODE1 are set to the correct value for the chosen oscillator frequency. The MODE settings are shown in the Oscillator section, Section 7. If you have a choice between two values, choose the value with the highest multiplier ratio since that will boot faster.

#### H.5 Boot

X0D01 has a 1K pull-up to VDDIO (Section 8).

- The device is kept in reset for at least 1 ms after VDDIO has reached its minimum level (Section 8).
- H.6 JTAG, XScope, and debugging
  - You have decided as to whether you need an XSYS header or not (Section G)
  - $\Box$  If you have not included an XSYS header, you have devised a method to program the SPI-flash or OTP (Section G).
- H.7 GPIO
  - $\Box$  You have not mapped both inputs and outputs to the same multi-bit port.
  - Pins X0D04, X0D05, X0D06, and X0D07 are output only and are, during and after reset, pulled low or not connected (Section 8)
  - Pins X2D04, X2D05, X2D06 and X2D07 are output only and during and after reset, X2D06 is pulled high and X2D04, X2D05, and X2D07 are pulled low (Section 8)

#### H.8 Multi device designs

Skip this section if your design only includes a single XMOS device.

- One device is connected to a QSPI or SPI flash for booting.
- Devices that boot from link have, for example, X0D06 pulled high and have link XL0 connected to a device to boot from (Section 8).

# I PCB Layout Design Check List

M This section is a checklist for use by PCB designers using the XS2-UF24B-1024-FB374. Each of the following sections contains items to check for each design.

#### I.1 Ground Plane

- Each ground ball has a via to minimize impedance and conduct heat away from the device. (Section 12.4)
- Other than ground vias, there are no (or only a few) vias underneath or closely around the device. This create a good, solid, ground plane.

#### I.2 Power supply decoupling

- $\Box$  The decoupling capacitors are all placed close to a supply pin (Section 12).
- $\Box$  The decoupling capacitors are spaced around the device (Section 12).
- The ground side of each decoupling capacitor has a direct path back to the center ground of the device.
- I.3 PLL\_AVDD
  - The PLL\_AVDD filter (especially the capacitor) is placed close to the PLL\_AVDD pin (Section 12).

# L Revision History

Date	Description
2015-03-20	Preliminary release
2015-04-14	Added RST to pins to be pulled hard, and removed reference to TCK from Errata
	Removed TRST_N references in packages that have no TRST_N
	New diagram for boot from embedded flash showing ports
	Pull up requirements for shared clock and external resistor for QSPI
2015-05-06	Removed references to DEBUG_N
2015-07-09	Updated electrical characteristics - Section 13
2015-08-19	Added I(USB_VDD) - Section 13
	Added USB layout guidelines - Section 12
2015-08-27	Updated part marking and product code - Section 15
2015-11-23	Updated status of X2D04, X2D05, X2D06, X2D07 during boot - Section 8
	Updated Schematics Design Checklist: GPIO for X2D04, X2D05, X2D06, X2D07 during boot - Section $\rm H$
2015-12-18	Clarified connectivity of internal and external xCONNECT links - Sections 3 and 4
	Made pin names canonical - Sections 3 and 4
	Updated JTAG diagram - Section 11
	Removed references to 400MHz parts - Section 13
2016-01-05	Updated signal tables to use VDDIO - Section 4
	Updated IDD value - Section 13
	Updated land pattern description - Section 12.3
2016-04-20	Typical internal pull-up and pull down current diagrams added - Section 13
2017-02-02	Updated USB VBUS wiring description with bus-powered usb-device instructions - Section 10 $$
2017-09-19	Added Absolute Maximum Ratings - Section 13.1
	Reference document links updated - Section J
2018-03-23	Incorrect IDCODE return value updated - Section 11
	Incorrect VBUS signal name updated to GND in USB diagrams - Section 10
2020-10-05	Released documentation for A revision that uses different flash - Section 8
