

# Lock handling Library

This library provides access to hardware and software locks for use in concurrent C programs. In general it is not safe to use these to marshall within XC due to the assumptions XC makes about safe concurrent data access.

Two types of locks are provided. Hardware locks are fast and power efficient but there are a limited number per tile. Software locks are slower but you can use an unlimited number of them.

### Software version and dependencies

This document pertains to version 2.0.3 of this library. It is known to work on version 14.2.3 of the xTIMEcomposer tools suite, it may work on other versions.

The library does not have any dependencies (i.e. it does not rely on any other libraries).

# 1 Hardware lock API

| Туре        | hwlock_t                              |
|-------------|---------------------------------------|
| Description | This type represents a hardware lock. |
|             |                                       |

| Function    | hwlock_alloc  |
|-------------|---|
| Description | Allocate a hardware lock.<br>This function will allocate a new hardware lock from the pool of hardware locks avail-<br>able on the xCORE. The hardware has a limited number of hardware locks (for exam-<br>ple, current L and S series devices have 4 locks per tile). |
| Туре        | <pre>hwlock_t hwlock_alloc(void)</pre>  |
| Returns     | the allocated lock if allocation is successful or the value HWLOCK_NOT_ALLOCATED if not.  |

| Function    | hwlock_free  |
|-------------|--|
| Description | Free a hardware lock.<br>This function frees a given hardware lock and returns it to the hardware pool to be<br>reallocated elsewhere. |
| Туре        | <pre>void hwlock_free(hwlock_t lock)</pre>   |
| Parameters  | lock the hardware lock to be freed. If this is an invalid lock id or not an currently allocated lock then the function will trap.      |

2

| Function    | hwlock_acquire  |
|-------------|---|
| Description | Acquire a hardware lock.<br>This function acquires a lock for the current logical core. If another core holds the<br>lock the function will pause until the lock is released. |
| Туре        | <pre>void hwlock_acquire(hwlock_t lock)</pre>   |
| Parameters  | lock the hardware lock to acquire   |

| Function    | hwlock_release  |
|-------------|---|
| Description | Release a hardware lock.<br>This function releases a lock from the current logical core. The lock should have been<br>previously claimed by hwlock_acquire(). |
| Туре        | <pre>void hwlock_release(hwlock_t lock)</pre>   |
| Parameters  | lock the hardware lock to release   |

=

# 2 Software lock API

| Туре        | swlock_t                              |
|-------------|---------------------------------------|
| Description | Type that represents a software lock. |
|             |                                       |

| Macro       | SWLOCK_INITIAL_VALUE  |
|-------------|---|
| Description | This define should be used to initialize a software lock e.g.     |
|             | <pre>swlock_t my_lock = SWLOCK_INITIAL_VALUE;</pre>               |
|             | If you intialize this way there is no need to call swlock_init(). |

| Function    | swlock_init   |
|-------------|---|
| Description | Initialize a software lock.<br>This function will initialize a software lock for use. Note that unlike hardware locks,<br>there is no need to allocate or free a software lock from a limited pool. |
| Туре        | <pre>void swlock_init(swlock_t &amp;lock)</pre>   |

| Function    | swlock_try_acquire  |
|-------------|---|
| Description | Try and acquire a software lock.<br>This function tries to acquire a lock for the current logical core. If another core holds<br>the lock then the function will fail and return. |
| Туре        | <pre>int swlock_try_acquire(swlock_t &amp;lock)</pre>   |
| Parameters  | lock the software lock to acquire.  |
| Returns     | a value that is equal to SWLOCK_NOT_ACQUIRED if the attempt fails. Any other value indicates that the acquisition has succeeded.  |

| Function    | swlock_acquire  |
|-------------|---|
| Description | Acquire a software lock.<br>This function acquires a lock for the current logical core. If another core holds the<br>lock then the function will wait until it becomes available. |
| Туре        | <pre>void swlock_acquire(swlock_t &amp;lock)</pre>  |
| Parameters  | lock the software lock to acquire.  |

=

| Function    | swlock_release   |
|-------------|--|
| Description | Release a software lock.<br>This function releases a previously acquired software lock for other cores to use. |
| Туре        | <pre>void swlock_release(swlock_t &amp;lock)</pre>   |
| Parameters  | lock the software lock to release.   |

2

### **APPENDIX A** - Known Issues

No known issues.

# APPENDIX B - Locks library change log

### B.1 2.0.3

• RESOLVED: Fixed the software locks when using high priority cores

### B.2 2.0.2

• CHANGE: Update to source code license and copyright

### B.3 2.0.1

• CHANGE: Update to use lock resource macro from the standard library to prevent compile warning

#### B.4 2.0.0

• CHANGE: Restructured library
