

# XSIM Command-Line Manual

---

## IN THIS DOCUMENT

- ▶ Overall Options
  - ▶ Warning Options
  - ▶ Tracing Options
  - ▶ Loopback Plugin Options
  - ▶ xSCOPE Options
- 

XSIM performs a cycle-based simulation of an XMOS Executable (XE) file. The XE file contains a description of the target hardware.

## 1 Overall Options

- xe-file* Specifies an XE file to simulate.
- `--max-cycles` *n*  
Exits when *n* system cycles is reached.
- `--plugin` *name args*  
Loads a plugin DLL. The format of *args* is determined by the plugin; if *args* contains any spaces, it must be enclosed in quotes.
- `--stats` On exit, prints the following:
  - ▶ A breakdown of the instruction counts for each logical core.
  - ▶ The number of data and control tokens sent through the switches.
- `--help` Prints a description of the supported command line options.
- `--version` Displays the version number and copyrights.

## 2 Warning Options

- `--warn-resources`  
Prints (on standard error) warning messages for the following:
  - ▶ A timed input or output operation specifies a time in the past.
  - ▶ The data in a buffered port's transfer register is overwritten before it is input by the processor.

`--warn-stack`  
 Turns on warnings about possible stack corruption.  
 XSIM prints a warning if one XC task attempts to read or write to another task's workspace. This can happen if the stack space for a task is specified using either `#pragma stackfunction` (see [XM-000959-PC](#)) or `#pragma stackcalls` (see [XM-000959-PC](#)).

`--no-warn-registers`  
 Don't warn when a register is read before being written.

### 3 Tracing Options

`--trace`  
`-t` Turns on instruction tracing for all tiles (see Figure 1).

`--trace-to file`  
 Turns on instruction tracing for all tiles. The trace is output to *file*.

`--disable-rom-tracing`  
 Turns off tracing for all instructions executed from ROM.

`--enable-fnop-tracing`  
 Turns on tracing of FNOP instructions.

Figure 1: Trace output for XS1 processors

Tile	Core State										Address		Instruction		Mem	Cycle
Name from XN	l <sub>0</sub>	l <sub>1</sub>	l <sub>2</sub>	S <sub>0</sub>	S <sub>1</sub> (T <sub>0</sub> ) .. S <sub>0</sub> S <sub>1</sub> (T <sub>n</sub> )	.	M	S	K	N	PC	( sym + offset ) :	name	operands	address	oval
	-	*	-	-	a b		-	-	-	-				val	L[adr]	
	D	P	d	a	b		m	s	k	n				r <sub>n</sub> (val)	S[adr]	
				A	i									res[id]		
				I	e											
				P												
				m												
				s												
				w												
l <sub>0</sub> : -	No debug interrupt										S <sub>1</sub> : -	Interrupts and events disabled				
l <sub>0</sub> : D	Instruction caused debug interrupt										S <sub>1</sub> : b	Interrupts and events enabled				
l <sub>1</sub> : *	Instruction excepted										S <sub>1</sub> : i	Interrupts enabled and events disabled				
l <sub>1</sub> : P	Instruction paused										S <sub>1</sub> : e	Interrupts disabled and events enabled				
l <sub>2</sub> : -	Not in debug mode										M : -	MSYNC not set				
l <sub>2</sub> : d	Tile in debug mode										M : m	MSYNC set				
S <sub>0</sub> : -	Core not in use										S : -	SSYNC not set				
S <sub>0</sub> : a	Core active										S : s	SSYNC set				
S <sub>0</sub> : A	Core active (the instruction being traced belongs to this core)										K : -	INK not set				
S <sub>0</sub> : i	Core active with ININT bit set										K : k	INK set				
S <sub>0</sub> : I	Core active with ININT bit set (belongs to this core)										N : -	INENB not set				
S <sub>0</sub> : p	Core paused due to instruction fetch										N : n	INENB set				
S <sub>0</sub> : m	Core paused with MSYNC bit set										r <sub>n</sub> (val)	Value of register <i>n</i>				
S <sub>0</sub> : s	Core paused with SSYNC bit set										res[id]	Resource identifier				
S <sub>0</sub> : w	Core paused with WAITING bit set										L/S[adr]	Load from/Store to address				

`--vcd-tracing` *args*

Enables signal tracing. The trace data is output in the standard VCD file format.

If *args* contains any spaces, it must be enclosed in quotes. Its format is:

```
global-optionsopt<-tile name <trace-options>)**
```

The global options are:

`-pads` Turns on pad tracing.

`-o file` Places output in *file*.

The trace options are specific to the tile associated with the XN core declaration name, for example `tile[0]`.

The trace options are:

`-ports` Turns on port tracing.

`-ports-detailed`  
Turns on more detailed port tracing.

`-cycles` Turns on clock cycle tracing.

`-clock-blocks`  
Turns on clock block tracing.

`-cores` Turns on logical core tracing.

`-instructions`  
Turns on instruction tracing.

To output traces from different nodes, tiles or logical cores to different files, this option can be specified multiple times.

For example, the following command configures the simulator to trace the ports on `tile[0]` to the file `trace.vcd`.

```
▶ xsim a.xe --vcd-tracing "-o trace.vcd -start-disabled -tile tile[0]
  -ports"
```

Tracing by the VCD plugin can be enabled and disabled using the `_traceStart()` and `_traceStop()` syscalls. The `-start-disabled` argument disables the vcd tracing from the start, allowing the user to enable/disable only those sections of code where tracing is desired. For example:

```
#include <xs1.h>
#include <syscall.h>

port p1 = XS1_PORT_1A;

int main() {
    p1 <: 1;
    p1 <: 0;

    _traceStart();
    p1 <: 1;
    p1 <: 0;
    _traceStop();

    p1 <: 1;
    p1 <: 0;

    return 0;
}
```

## 4 Loopback Plugin Options

The XMOS Loopback plugin configures any two ports on the target platform to be connected together. The format of the arguments to the plugin are:

`-pin package pin`

Specifies the pin by its name on a package datasheet. The value of *package* must match the `Id` attribute of a `Package` node (see [XM-000929-PC](#)) in the XN file used to compile the program.

`-port name n offset`

Specifies *n* pins that correspond to a named port.

The value of *name* must match the `Name` attribute of a `Port` node (see [XM-000929-PC](#)) in the XN file used to compile the program.

Setting *offset* to a non-zero value specifies a subset of the available pins.

`-port tile p n offset`

Specifies *n* pins that are connected to the port *p* on a *tile*.

The value of *tile* must match the `Reference` attribute of a `Tile` node (see [XM-000929-PC](#)) in the XN file used to compile the program.

*p* can be any of the port identifiers defined in `<xs1.h>`. Setting *offset* to a non-zero value specifies a subset of the available pins.

The plugin options are specified in pairs, one for each end of the connection. For example, the following command configures the simulator to loopback the pin connected to port `XS1_PORT_1A` on `tile[0]` to the pin defined by the port `UART_TX` in the program.

```
▶ xsim uart.xe --plugin LoopbackPort.dll '-port tile[0] XS1_PORT_1A 1 0 -port UART_TX 1 0'
```

## 5 xSCOPE Options

`--xscope args`

Enables xSCOPE. file format.

If *args* contains any spaces, it must be enclosed in quotes. One of the following 2 options is mandatory:

`-offline <filename>`

Runs with xSCOPE in offline mode, placing the xSCOPE output in the given file.

`-realtime <URL:port>`

Runs with xSCOPE in realtime mode, sending the xSCOPE output in the given URL:port.

The following argument is optional:

`-limit <num records>`

Limits the xSCOPE output records to the given number.

For example, the following will run `xsim` with xSCOPE enabled in offline mode:

```
▶ xsim app.xe --xscope "-offline xscope.xmt"
```

For example, the following will run `xsim` with xSCOPE enabled in realtime mode:

```
▶ xsim app.xe --xscope "-realtime localhost:12345"
```
